

Coldfix

Cold bitumen joint / crack / bar hole sealer

Water ingress to joints and cracks is the main cause of road surface failure. Coldfix sealant is a quick and clean, ready to use system that can be used during works or as a remedial measure. No COSHH issues, no specialist skill, kit or hot works / noticing required. Coldfix is flow-able and finds gaps/breaks and then self levels to leave an almost invisible repair. Skid resistance properties of the asphalt are unchanged. Fine aggregate can be broadcast into Coldfix prior to it curing and traffic can be returned immediately. This joint sealing example took less than one minute to complete. Coldfix comes in 380ml cartridges – one cartridge will cover approximately 40 linear m linear metres of 6mm bead.
