

**PA-DRESS**

- IDEALLY SUITED
- UNSUITABLE
- OCCASIONAL USE

**DESCRIPTION:**

The aluminium oxide, diamond blade dressing stone is a simple and effective way to bring dulled diamond blades back to life.

When a diamond blade is used on a material that is too hard for the blade's bond system, the segment will not wear and expose fresh diamonds, as it is designed to. When this happens, the exposed diamonds on the cutting edge become dull, and lose their sharp cutting edge. At this point the blade will stop cutting effectively.

By simply cutting through the dressing stone 3 or 4 times, this can be enough to expose the fresh layer of cutting diamond, and revitalise the blade.

**USER TIPS:**

- Always wear the appropriate PPE
- Ensure that the dressing stone is secured before cutting
- Make 3 or 4 cuts through the width of the dressing stone, using your usual machine
- If you are cutting a problematic material, it is advised that you use the dressing stone periodically, and not wait for the blade to dull before re-dressing it

**PART NO.    DIMENSIONS**

PA10001    Diamond Blade Dressing Stone

**PACKAGING DETAILS:**

Full Colour Cardboard Sleeve.
